

What is claimed is:

1. A digital codeless telephone that uses a public telephone network, wherein:

5 a transmitter calls a receiver by means of a message that has a group identification code for direct communication between personal stations and a waiting mode change request information; and

the receiver changes the waiting mode according to the message, whereby the receiver is made to prepare for receiving.

10 2. The digital codeless telephone as claimed in Claim 1, wherein a called party subaddress or a calling party subaddress is used as the message.

3. A digital codeless telephone that uses a public telephone network, wherein:

15 a transmitter calls a receiver by means of a message that has a group identification code for direct communication between personal stations; and

the receiver holds the group identification code for direct communication between the personal stations, whereby a
20 direct communication between cordless hand sets is registered.
